By Contributor Updated December 10, 2019 Using the "Text to Speech" software on your Windows-based computer can be learned in a matter of minutes. The "Text to Speech" utility allows you to configure your computer so the machine recognizes the words you type on screen and converts them into a computerized voice audible through the speakers. Click "Start" and select "Control Panels" from the menu. Under "Control Panels," select "Speech." Select the voice you want the computer to use by selecting the "Voice Selection" drop-down menu on the "Text to Speech" tab. There are as many as 12 voices available on most Windows-based computers. More voices are available to download for free at Microsoft.com. Preview the voice you chose by selecting "Preview Voice" at the bottom of the screen. On screen, you will notice the text is highlighted when the voice reads as you type. If the voice sounds fine, click "OK." Open a word processing program, such as Microsoft Word, and begin to type. The program should provide an audio representation of what is being written on the screen. By Natasha Parks | Thinkstock Images/Comstock/Getty Images

Speech-to-text devices save users time by translating audio recordings into on-screen text. Although the device is computer-related hardware, the speech recognition and translation process is completed by speech recognition software. There are several different digital-voice recorders from which to choose, and a few types of speech recognition programs. This pay-as-you-go subscription software has a range of features which work on any cell phone. Users can create and send 15-second text messages using their voice. It can also be used to update social networking statuses, and even create short "Twitter"-style captions, which are then synced with your personal Internet accounts via wireless or a GPS (Global Positioning System). Vlingo Plus is speech-recognition software for BlackBerry users. Rather than a pay-as-you-go system, this requires a basic on-off purchase. The program allows users to tell their BlackBerry phones to text, email, call and update statuses with short pieces of text via a side key. This key is easy to locate by touch even when you cannot see the device properly, such as in the dark or when you are jogging. BigHand is a speech-to-text program designed and implemented by United Kingdom-based company BigHand. Users record their voice using what is basically a dictaphone inside a mobile communications device (such as a smart phone or BlackBerry). The voice recording is then sent to a speech recognition workflow and the sounds (words) are transcribed into text, optionally with proofing, which adds accuracy and readability. It is useful for detailed text, such as law documentation and note-taking. Any mistakes can be corrected by the user, as described by BigHand. Dragon is a versatile dictation program, made by Nuance, which allows users in a variety of professions to create and edit data in documentation and email without having to type - they simply make the changes using voice commands. Also, full pieces of work can be developed using dictation rather than typing, simply by turning the program on and speaking into the microphone as it records. Dragon offers speech-driven clinical documentation and communication for the healthcare industry. Dragon is also being used to improve customer interactions for a variety of communications companies and call centers. To get the most from any speech recognition device or software program, the program must be trained to recognize a minimum number of real voices. This is because the algorithms within the software work by learning the nuances of the person's voice and accent over time. If the device is used by one person or a small group of people, it can have an accuracy of 85 percent, but this falls rapidly for larger numbers of users. Recognition software also works by learning from its mistakes, so it's always wise to perform manual corrections following a translation. While Discord is a great platform for voice communication, you might not be able to (or want to) speak with your own voice. To get around the problem, you can use Discord's built-in text-to-speech (TTS) feature. You can use text-to-speech on your own Discord server, or on another server with a text-to-speech enabled channel. These steps only work for Discord users on Windows or Mac, as Discord's text-to-speech capabilities are unavailable to Android, iPhone, or iPad users. RELATED: How to Set Up Your Own Discord Chat Server Enabling Text-to-Speech on a Discord Server If you want to use text-to-speech on Discord, it'll first need to be enabled in a channel on your server. If you're the server owner or administrator, you can do this in your channel settings. To change your channel settings, access your server in the Discord desktop app or on the Discord website. From the channel listings, hover over a channel name and then click the "Settings" gear icon next to it. In the "Settings" menu for your channel, select the "Permissions" tab on the left-hand side. If you have roles for individual groups of users, select the role from the "Roles/Members" list, otherwise select the "@everyone" option. A list of available permissions will be shown on the right. Make sure to enable the "Send TTS Messages" option by clicking the green check icon to the right of it. At the bottom, select "Save Changes" to save the updated role setting. Once enabled, users with that role (or every user, if you selected the "@everyone" role) will be able to send text-to-speech messages in the channel you modified. You'll need to repeat these steps if you wish to enable text-to-speech in other channels. Using Text-to-Speech On Discord If you're in a channel on Discord with text-to-speech messages enabled, you can send a TTS message by typing /tts in the chat, followed by your message. For instance, typing /tts hello will activate your browser or device's text-to-speech capabilities, repeating the word "hello" along with the nickname of the Discord user who sent the message. The message will also be repeated in the channel as a text message for all users to view. Muting All Text-to-Speech Messages on Discord If you aren't a server owner or administrator, or you just want to mute all text-to-speech messages, you can do so from the Discord user settings menu. To access this, click the "Settings" gear icon next to your username in the bottom-left corner of the Discord app or website. In your "User Settings" menu, select the "Text & Images" option on the left. Under the "Text-To-Speech" category on the right, click the slider to disable the "Allow playback and usage of /tts command" option. Disabling this setting will disable text-to-speech for you on Discord, regardless of each individual server or channel setting. You'll be able to read the text element of a text-to-speech message as normal in the channel, but you won't be able to hear it repeated to you. You'll also be prevented from using the /tts command yourself. You'll need to repeat these steps and reenable the option in your user settings if you wish to use it yourself later.
